THE POWER OF A WELL-MESHED GROUP.

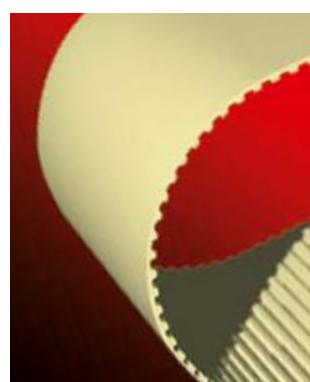

CONTI SYNCHROFLEX® Timing Belts

Advanced manufacture and high-performance materials combine for product excellence

CONTI SYNCHROFLEX® Polyurethane Timing Belts deliver best-in-class power transmission performance thanks to the uncompromising selection of high-grade components and the superior bonding strength between the hard-wearing polyurethane shell and the constant-length galvanised steel tension members.

The highly flexible production process is particularly suitable for manufacturing double-sided belts and high accuracy profiles on the belt back. A range of specialist compounds and materials are available to enable operation at low temperatures, in clean rooms and in the food industry.

Manufacturing process

CONTI SYNCHROFLEX® Polyurethane Timing Belts consist of two components – a cast Polyurethane shell and a high grade steel cord tension member. The excellent bond between the two materials results in a very high power transmission capacity.

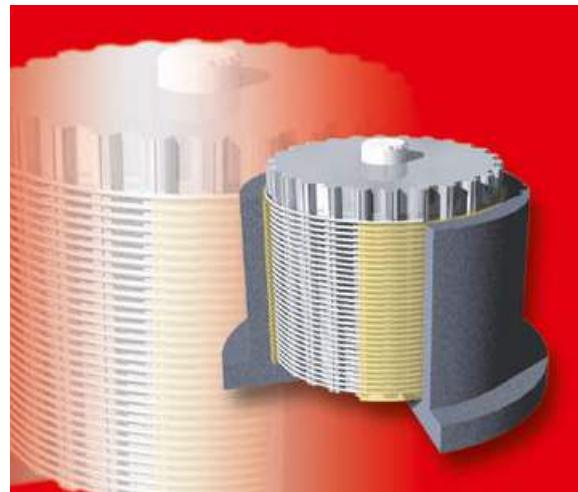

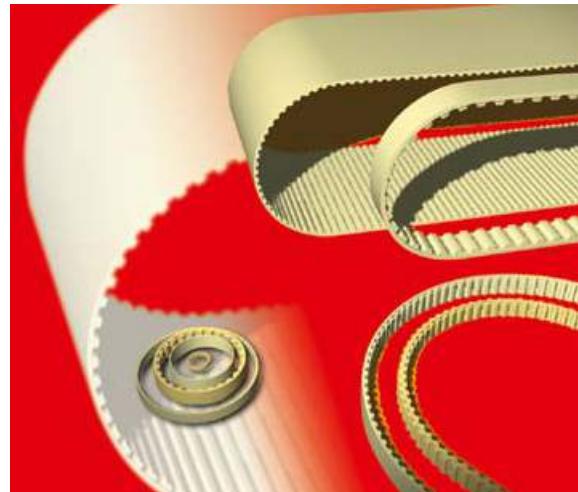

The manufacturing process – cast moulded polyurethane – combines the following advantages:

- The cast polyurethane timing belt is an exact image of the precision engineered mould. High pitch accuracy is achieved over the entire belt. The technology is particularly suitable for applications requiring high levels of angular accuracy, smooth running characteristics, high rotational speeds and long life.
- Excellent linearity with high pitch accuracy and repeatability allows the length to be optimised by adjusting the cord tension.
- The casting method combines with the capillary effect, producing an exceptionally high strength bond with the steel tension members.
- The high reproduction quality of the cast polyurethane process enables fine contoured features and smaller belt pitches to be moulded. Double-sided belts and profiled flights on the back of the belt can be moulded simultaneously.
- The process produces an effective belt width of up to 300 mm.
- Belt lengths from 55 mm to 6000 mm endless length.

CONTI SYNCHROFLEX® Polyurethane Timing Belts are used across a very wide range of applications for the transmission of synchronous rotary motion in power transmission systems, servo and motion controls, conveyors and transfer lines. They operate in a rotational speed range of up to 20,000 rpm.

Applications include:

- office machinery
- electronic data processing equipment (EDP)
- textile machinery
- wood processing machinery
- machine tools
- printing machinery
- pumps
- compressors
- building machinery

Casting mould, illustrated with a spirally wound tension member on the mould core.

Ready de-moulded timing belt sleeve, partly separated into individual belts.

Construction

CONTI SYNCHROFLEX® Polyurethane Timing Belts are manufactured from wear resistant Polyurethane and high tensile steel cord tension members. Both high quality materials combine to form the basis for dimensionally stable and highly durable polyurethane timing belts. Polyurethane timing belts have very high longitudinal stiffness and no post-elongation of the tension members is to be expected in continuous operation. Only under extreme loading conditions and as a precaution after a brief run-in, a small loss of tension may necessitate a once-only retensioning.

The timing belts are temperature resistant with ambient temperatures from -30°C to +80°C. However, applications close to these temperature limits (< -10°C and > +50°C), may require adapted dimensioning. For specific temperature ranges, optional belt materials are available; e.g. the CONTI SYNCHROFLEX® GEN III Polyurethane Timing Belt range is temperature resistant up to +100°C. Please contact our technical specialists for this type of application.

CONTI SYNCHROFLEX® Polyurethane Timing Belts are manufactured using production methods that maintain very high tolerances to ensure a uniform load distribution during power transmission. They are equally suited for high torque transmission and precise positioning applications or the combination of both.

Properties:

mechanical

- positive fit, synchronous running
- constant length, no post-elongation
- low noise
- wear resistant
- low-maintenance
- highly flexible
- positional and angular accuracy
- fatigue resistant, low extension steel cord tension members
- belt speeds up to 80 ms⁻¹
- small production quantities available
- excellent power-to-weight ratio
- low pre-tension
- low bearing loads
- permits large centre distances
- permits large transmission ratios
- high degree of efficiency, max. 98%

chemical

- hydrolysis stabilized
- resistant to aging
- temperature resistant from -30°C to 80°C, note: CONTI SYNCHROFLEX® Polyurethane Timing Belt GEN III up to 100°C (see information in the text "Construction")
- tropical climate resistant
- resistant against simple oils, fats and petrol
- resistant to some acids and alkalines

For further information about the environmental resistance characteristics of CONTI SYNCHROFLEX® Polyurethane Timing Belts please contact your Mulco sales partner.

Timing Belt Types

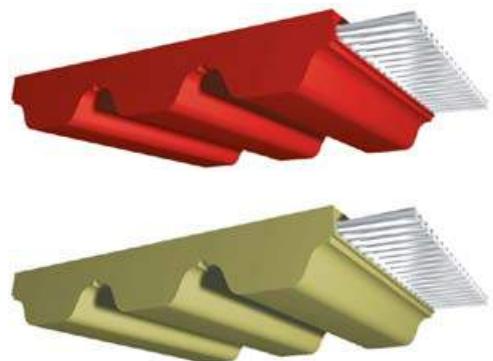

AT High capacity profile

Further development of the T profile resulted in the AT profile. This type of belt is characterised by the larger tooth shear strength resulting from the larger tooth volume and the stronger tension members.

Further advantages:

- favourable tooth mesh
- strengthened tension members for constant pitch
- Improved performance up to 50 % as compared to the T profile
- precise transmission of movement in conjunction with synchronous pulleys with reduced or zero backlash
- reduction of meshing impacts or shocks
- compact drive dimensions

(also available in the GEN III version)

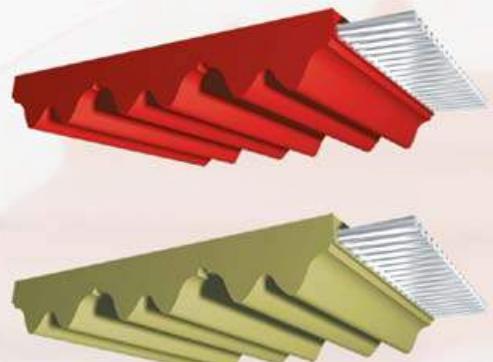

ATP High capacity profile

Further increased performance, noise reduction and extension of the belts useful life led to the development of the ATP timing belt in 1993. At the time, the main interest was focussed on the optimum tooth form. The basic concept of the new ATP profile provides the division of the trapezoidal tooth into two individual and load bearing teeth.

Performance increase up to 60 %, running noise reduced by up to 10 db(A) and an increased longevity by:

- tooth surface area increased by 70 %
- uniform load/tension distribution
- improved power dispersion
- reduced polygon effect
- small construction width
- optimised tooth mesh

(also available in the GEN III version)

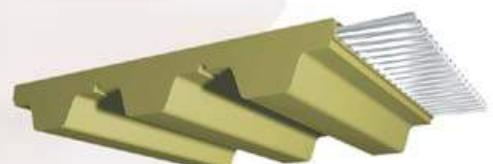

T Standard profile

The timing belt with a trapezoidal profile according to DIN 7721 is regarded as the classical standard timing belt.

Preferred use:

- for standard drive tasks
- transmission tasks with double-sided belts
- for high bending stress
- for drives with contraflexure

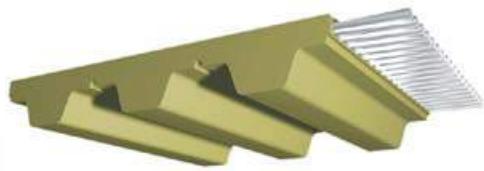

T in DL version

The DL timing belt (the belt is double-sided) is used in the power transmission and transport technology. Multiple-shaft drives with different rotational directions can be realised with this timing belt. Full load ability on both tooth sides.

**Imperial profile**

Imperial pitches according to DIN/ISO 5296 are available in the following sizes:

M (MXL)	=	2.032 mm
XL	=	5.080 mm
H	=	12.700 mm
		L = 9.525 mm
		XH = 22.225 mm

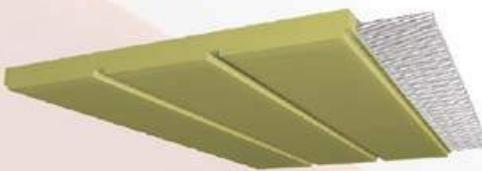

Preferred use:

- Applications in imperial units

F Flat belts

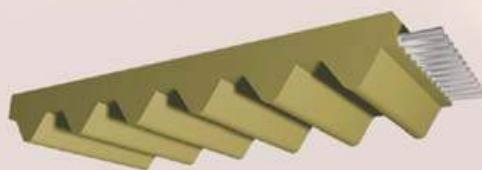

Preferred use:

- Friction drives (open length and endless)
- high-speed drives (CONTI SYNCHROFLEX® Belt)
- drives without synchronous transmission

**K** Serrated metric pitch profile.

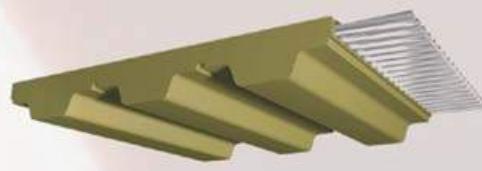

Preferred use:

- Fine mechanical technology requiring small dimensions

**V** The development of the PU timing belt started in 1954 with pitches other than standard.

Preferred use:

- tasks requiring special pitches
- spares

Please contact your nearest Mulco distributor to know more about our entire range of V-type belts.

Antistatic CONTI SYNCHROFLEX® Timing Belts

Characteristics of CONTI SYNCHROFLEX® Antistatic Timing Belts

The antistatic properties of CONTI SYNCHROFLEX® Polyurethane Timing Belts are achieved by:

1. antistatic coating

A post-process application of an electrically conductive coating on all sides of the belts with or without textile facing

2. antistatic polyurethane mixture

A special conductive polyurethane mixture (max. belt length to 700 mm)

Other lengths on request.

Colour of antistatic timing belts: black.

Application / Use

Antistatic CONTI SYNCHROFLEX® Polyurethane Timing Belts are used where electrostatic discharge (ESD) is not desired or is prohibited, e.g. for the transport of electronic components, for drives and/or conveying equipment in an inflammable or explosive environment.

Electrostatic charges

The build up of static electricity, due to the continual separation of two contact surfaces, can be expected where timing belts are involved, e.g. between pulley and timing belt. This static electric charge can be considerable and may increase the danger of ignition at the moment of discharge. The value of the static electric charge is dependent on the materials used for the timing belt, synchronous pulleys, tension rollers and/or support rollers. The risk of ESD rises as the belt speed, belt tension and the contact surface width increase.

Antistatic properties

Antistatic CONTI SYNCHROFLEX® Polyurethane Timing Belts consistently avoid the formation of static electric charges.

Quality assurance

Conductivity is measured using test equipment meeting ISO 9563 requirements. Upon request, the wear resistance of the antistatic layer can be checked on test timing belts with an antistatic facing. Due to the fact that extended operation will result in probable surface wear, the conductivity of the antistatic timing belts may deteriorate and regular checks of the resistance values are essential. When belts are to be used in environments with a high likelihood of explosion, please contact our technical specialists for advice.

Order example

antistatic coated

For available lengths, please contact your Mulco sales partner.

“E” Tension Member

Highly flexible tension members – the “E” steel cord tension member

The smaller the diameter of each single wire, the more flexible the overall tension member is! This relationship led us to develop CONTI SYNCHROFLEX® Polyurethane Timing Belts with “E” tension members.

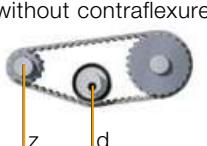

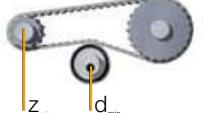

The cross sectional area of the “E” tension member comprises several strands of smaller diameter wires, each with excellent bending fatigue characteristics. With much improved overall flexibility CONTI SYNCHROFLEX® Polyurethane Timing Belts are particularly suited to smaller diameter pulleys and tension rollers; the minimum number of teeth and/or minimum diameter of the pulleys can be reduced by up to 30% compared with standard tension members. Timing belts with “E” tension members are recommended for multi-shaft drive applications with frequent reverse bending.

Summary:

- smaller diameter individual wires in the steel cord
- higher dynamic capabilities
- extremely high bonding and bending fatigue strength
- smaller pulley and tension roller diameters
- runs on standard diameter timing pulleys.

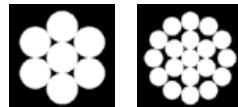

For applications under extreme conditions, please contact your Mulco sales partner.

Timing belts with “E” tension members, minimum numbers of teeth:

Drive Type		AT 3 (Standard)	AT 5 (GEN III, Standard)	AT 10 ATP 10	T 5	T 10	T 20
without contraflexure	 <p>Timing pulley z_{\min}</p> <p>Tension roller (smooth), running on teeth d_{\min} [mm]</p>	15	12	12	10	10	12
with contraflexure	 <p>Timing pulley z_{\min}</p> <p>Tension roller (smooth), running on the back of the belt d_{\min} [mm]</p>	20	20	20	12	15	20

Application information:

Steel cord tension members encapsulated in polyurethane:

The smaller the diameter of the individual wire, the more flexible the whole timing belt.

Available versions:

- for the pitches AT 3 (standard), AT 5 (Gen III standard), AT 10, ATP10, T 5, T 10, T 20
- all standard belt lengths for the chosen pitch
- all standard pulley sizes for the chosen pitch
- all calculations as per the standard belt chosen

High-power version GEN III

CONTI SYNCHROFLEX® Timing Belt (SFX) AT GEN III / ATP GEN III

A powerful basis

The combination of high tensile steel cord tension members and wear resistant polyurethane forms the basis for dimensionally stable and extremely durable high-performance timing belts. A convincing technology with excellent product features that include:

- constant length, no post-elongation
- high dimensional stability
- high-torque transmission
- quiet running
- maintenance-free
- lubrication-free
- highly chemical resistant and mechanically durable

Each generation is different.

GEN III is better!

It was worth its while to focus on further developing the power drives of the AT and ATP range CONTI SYNCHROFLEX® polyurethane timing belts because the new GEN III generation excels in a 25% increase in power transmission compared with the AT/ ATP standard. Another economic bonus: all CONTI SYNCHROFLEX® GEN III polyurethane timing belts support the use of standard AT/ATP pulleys.

Mulco partners everywhere agree that advancement is synonymous to providing solutions for every product at a level of sophistication down to the smallest detail. A bifilar tension member arrangement and a higher packing density translates this into the CONTI SYNCHROFLEX® GEN III polyurethane timing belt for the AT and ATP ranges.

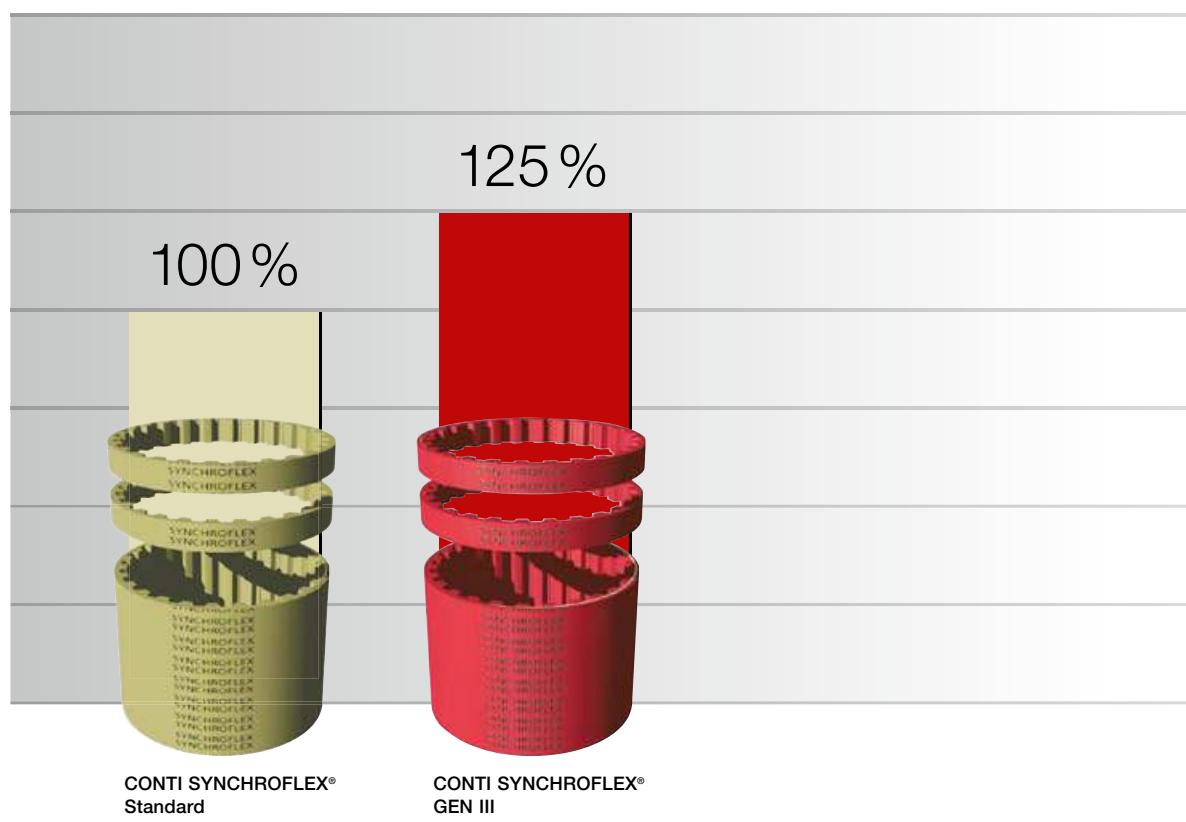

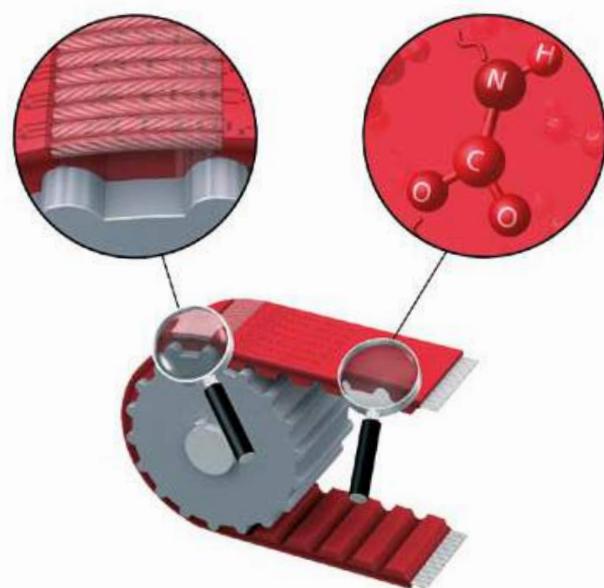

The high-performance polyurethane designed for dedicated use with the CONTI SYNCHROFLEX® GEN III polyurethane timing belts yields greatly improved benchmark results compared with the standard. One of the benefits is that its increased hardness allows line engineers to count on a larger number of load-carrying teeth.

CONTI SYNCHROFLEX® GEN III – with up to 25% greater power transmission compared with the AT / ATP standard:

- increased tensile force F_{zul} to max. +45% due to closer wound cords
- Increased power transmission F_{spec} +25%
- redesigned bifilar steel (S and Z) cord balance for better tracking
- reduced flange friction
- lower running noise with narrower belt width for equal performance
- longer life
- load bearing teeth force distribution – increased by up to 30%
- temperature range up to +100° C
(For performance values close to the range limit, please contact your Mulco sales partner.)

Belt performance table

Belt performance table

AT 3 GEN III

Power transmission:	$\leq 6 \text{ kW}$
Rotational speed:	approx. 20.000 min^{-1}
Peripheral speed:	approx. 80 ms^{-1}
Timing pulleys:	from $z=15$
Applications (Example):	small power drives, Handling technology

AT 3

Power transmission:	$\leq 5 \text{ kW}$
Rotational speed:	approx. 20.000 min^{-1}
Peripheral speed:	approx. 80 ms^{-1}
Timing pulleys:	from $z=15$
Applications (Example):	small power drives, Handling technology

AT 5 GEN III

Power transmission:	$\leq 18 \text{ kW}$
Rotational speed:	approx. 10.000 min^{-1}
Peripheral speed:	approx. 80 ms^{-1}
Timing pulleys:	from $z=15$
Applications (Example):	Machine tools, Pumps, Textile machinery

AT 5

Power transmission:	$\leq 15 \text{ kW}$
Rotational speed:	approx. 10.000 min^{-1}
Peripheral speed:	approx. 80 ms^{-1}
Timing pulleys:	from $z=15$
Applications (Example):	Machine tools, Pumps, Textile machinery

AT 10 GEN III

Power transmission:	$\leq 87 \text{ kW}$
Rotational speed:	approx. 10.000 min^{-1}
Peripheral speed:	approx. 60 ms^{-1}
Timing pulleys:	from $z=15$
Applications (Example):	Construction machines, Pumps, Paper-making machines, Compressors compactors, Textile machin- ery, Roller-table drives

AT 10

Power transmission:	$\leq 70 \text{ kW}$
Rotational speed:	approx. 10.000 min^{-1}
Peripheral speed:	approx. 60 ms^{-1}
Timing pulleys:	from $z=15$
Applications (Example):	Construction machines, Pumps, Paper-making machines, Compressors compactors, Textile machin- ery, Roller-table drives

ATP 10 GEN III

Power transmission:	$\leq 150 \text{ kW}$
Rotational speed:	approx. 10.000 min^{-1}
Peripheral speed:	approx. 60 ms^{-1}
Timing pulleys:	from $z=15$
Applications (Example):	Machine tools, Textile machinery, Power drives

ATP 10

Power transmission:	$\leq 100 \text{ kW}$
Rotational speed:	approx. 10.000 min^{-1}
Peripheral speed:	approx. 60 ms^{-1}
Timing pulleys:	from $z=15$
Applications (Example):	Sanding machinery, Power drives, Machine tools

ATP 15 GEN III

Power transmission:	possible beyond 220 kW
Rotational speed:	approx. 10.000 min ⁻¹
Peripheral speed:	approx. 50 ms ⁻¹
Timing pulleys:	from z=20
Applications (Example):	Textile machinery, Machine tools, High power drives

ATP 15

Power transmission:	possible beyond 200 kW
Rotational speed:	approx. 10.000 min ⁻¹
Peripheral speed:	approx. 50 ms ⁻¹
Timing pulleys:	from z=20
Applications (Example):	Power drives, Machine tools

AT 20 GEN III

Power transmission:	possible beyond 2250 kW
Rotational speed:	approx. 6.500 min ⁻¹
Peripheral speed:	approx. 40 ms ⁻¹
Timing pulleys:	from z=18
Applications (Example):	Heavy-duty drives, Textile machinery, Printing machine, Machine tools

AT 20

Power transmission:	possible beyond 200 kW
Rotational speed:	approx. 6.500 min ⁻¹
Peripheral speed:	approx. 40 ms ⁻¹
Timing pulleys:	from z=18
Applications (Example):	Heavy-duty drives, Textile machinery, Printing Machine, Machine tools

K 1,5; T 2; M; T 2,5

Power transmission:	≤ 0,5 kW
Rotational speed:	approx. 20.000 min ⁻¹
Peripheral speed:	approx. 80 ms ⁻¹
Timing pulleys:	from z=10
Applications (Example):	Precision machine drives, Film camera drives, Positioning drives

T 5

Power transmission:	≤ 5 kW
Rotational speed:	approx. 10.000 min ⁻¹
Peripheral speed:	approx. 80 ms ⁻¹
Timing pulleys:	from z=10
Applications (Example):	Office machinery, Home appliances, Positioning and regulating drives

T 10

Power transmission:	≤ 30 kW
Rotational speed:	approx. 10.000 min ⁻¹
Peripheral speed:	approx. 60 ms ⁻¹
Timing pulleys:	from z=12
Applications (Example):	Machine tools, Main and subsidiary drives, Textile machinery, Printing machinery

T 20

Power transmission:	up to approx. 100 kW
Rotational speed:	approx. 6.500 min ⁻¹
Peripheral speed:	approx. 40 ms ⁻¹
Timing pulleys:	from z=15
Applications (Example):	Heavy Construction machines, Paper-making machines, Pumps, Compressors compactors, Textile machinery

Remark:

Special timing belt designs allow the rpm and peripheral speed parameters to be increased.

Tolerances

CONTI SYNCHROFLEX® Timing Belts Tolerances

**Length tolerances for standard
CONTI SYNCHROFLEX® Polyurethane
Timing Belts**

Belt length measurement is carried out to DIN 7721, in relation to the centre distance.

Belt length	Length tolerance in relation to centre distance
up to 320 mm	± 0,15 mm
320 – 630 mm	± 0,18 mm
630 – 1000 mm	± 0,25 mm
1000 – 1960 mm	± 0,40 mm
1960 – 3500 mm	± 0,50 mm

Mulco b@lt-pilot

Your direct road to perfect design solutions

Mulco belt-pilot – online support at www.mulco.net

Let others talk about being close to the customer, we as the market leading provider of polyurethane timing belts actually live by the idea. Mulco-Europe EWIV's secret of success has always been largely due to advising our customers before they enter the design stage. Mulco belt-pilot is taking our customer dedication a critical step further ahead. Our interactive Internet service offering enables you to calculate your personal design solutions online. Whatever field of technology you are interested in - power transmission, linear, transport or components - start Mulco belt-pilot at www.mulco.net for 24/7 access to the actual product information, CAD downloads and calculations you need.

Mulco b@lt-pilot

Many benefits.

- Interactive service offering with video-based e-learning option
- Extensive product databases
- Free use of CAD downloads
- Import the CAD drawings into your CAD system
- Calculate timing belts, pulleys and components
- Email inquiries supported

Belt tension gauges

Setting the correct pre-tension force

Clavis and SM4 belt tension gauges – simple, practical and efficient

Clavis and SM4 belt tension gauges allow you to measure the resonant frequency of a vibrating belt span. This resonant frequency directly depends on the belt tension. When starting to use or servicing a drive, these gauges are indispensable when it comes to properly adjusting the pre-tension force. A correct pre-tension force minimizes the load on the bearings, optimizes the running of the belt and, thus, extends the life of the drive. Moreover, it reduces the noise level and balances non-parallelism of wide polyurethane timing belts.

Clavis uses microphones to acoustically measure the frequency of the vibrating belt.

- Measuring ranges: 30 Hz ... 600 Hz (standard) and 10 Hz ... 300 Hz
- Precision: +/- 1 %
- For all polyurethane drive belt models with different tension members (e. g. steel, aramid, glass-fibre)
- Broad portfolio of replaceable sensor heads
- Integrated calibration equipment
- Battery-powered
- Steel tuning fork for fast frequency sampling included
- Ships with a calibration certificate and a case

Span tension gauge SM4 uses a sensor to measure the frequency of the vibrating belt.

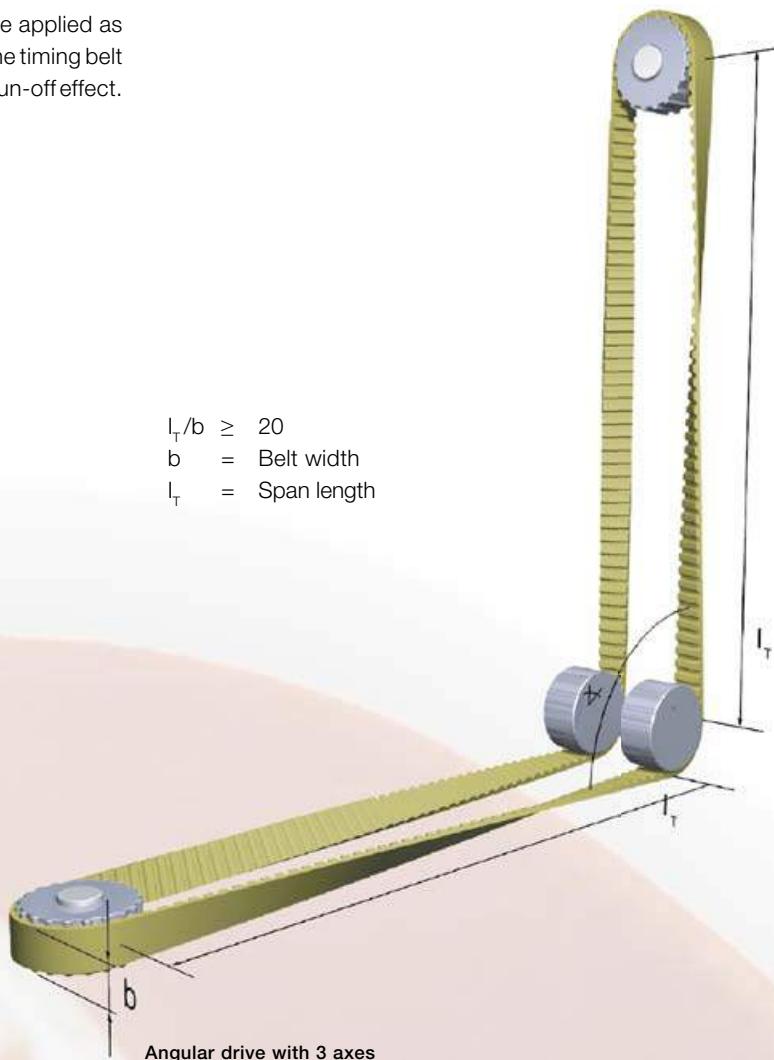

- Measuring range: 7 Hz ... 350 Hz
- Precision: +/- 5 %
- For all polyurethane drive belt models with different tension members (e. g. steel, aramid, glass-fibre)
- Large display
- Weighs just 110 g
- Belt clip
- Battery-powered
- Ships with a transport case and protective sleeve

Angular drives

CONTI SYNCHROFLEX® Timing Belts can be applied as angular drives. Take into consideration that the timing belt can only be crossed (twisted). Eliminates the run-off effect.

Angular drive with 2 axes

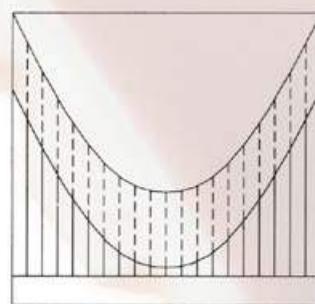

Angular drive with 3 axes

With crossed timing belt applications the outer tension members suffer a higher elongation than the inner ones. Due to the larger elongation in the edge zone the permitted proportional circumferential force for the belt in the tension members is reduced.

No power reductions or special measures are necessary at a ratio of $l_T / b \geq 20$.

At a required ratio of $l_T / b < 20$ please contact our technical department for advice.

F_{zul} admissible tensile force

F_u The remaining peripheral force

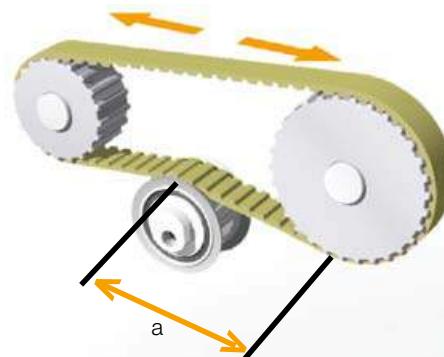

F_s Tensile force due to crossing

Guiding belts with flanges

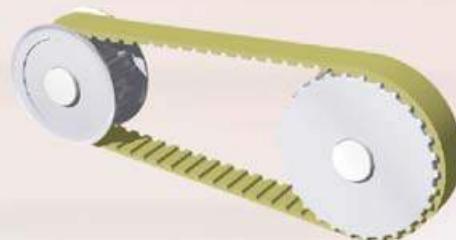

Timing belts must be guided to eliminate the lateral run-off effect. This is normally done by flanges. Minimum lateral forces and low frictional losses can be resulted by the optimum arrangement of the belt guidance.

For this purpose, the following possibilities are available:

- Timing belt guidance downstream of a large free span length (infeed length (a) should not be less than 5 times belt width)
- Guidance at the drive pulley (preferable for two shaft drives with short centre distance)
- Guide for low-transmission pulleys (preferably for multiple-shaft drives)
- Guidance on the tension rollers
 - Tension roller arrangement in the slack span side
 - With arrangement on the belt back side: consider minimum diameter with contraflexure
 - With arrangement on the belt toothed side: Length of arc of contact, min. 3 teeth
 - with changing rotational directions preferable in the span length centre
 - Condition: Minimum span length (a) between tension roller and pulley should not be less than 5 times belt width
- Ensure high axis parallelity and flush alignment of all pulleys to achieve optimum guiding features.
- For cost reasons it is possible to fit flanges also to the smaller pulley after taking the functional reliability into consideration.

The application of CONTI SYNCHROFLEX® polyurethane timing belts in two-filament arrangement is the ideal prerequisite for an optimum belt guidance.

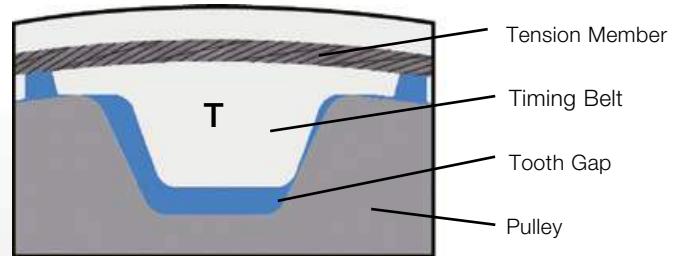

Tooth gap shapes

Timing belts are positive fitted drive elements. They work slippage-free with the respective synchronising pulleys. CONTI SYNCHROFLEX® timing belt drives can be optimised additionally for a movement transmission with a low flank backlash.

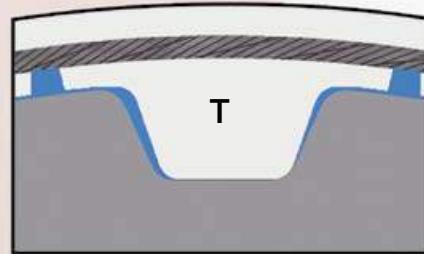

For some profiles and pitches, the SE or zero gap can be used for especially high accuracy drives. Please contact us for technical advice.

- Prerequisites for the application:
Pitch matching between timing belts and pulley.
- Influencing factors of the pitch matching:
 - Pre-tension force
 - No. of teeth in mesh (z_e)
 - Load rate (rotational speed, dynamic behaviour...)
 - Manufacturing tolerances

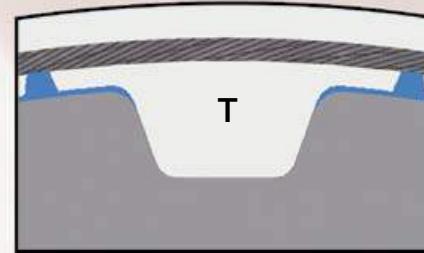

Tooth gap shapes

Normal Backlash
Tooth Gap

Reduced Backlash
"SE" Tooth Gap

Zero Backlash
"0" Tooth Gap

Safety factors

The width of a timing belt is correct when the permissible values for tooth shear strength, tension cord strength and flexibility are not exceeded under unfavourable operating conditions. In our catalogue, load limits are stated which have been reliably proven and confirmed by bench tests and results obtained in practice. A safety factor is only required for drives with transmission into higher speed.

Rated operation

Design timing belts for the operating condition of the rated load. The rated load is the operating condition at which the drive should transmit the torque or the power at rated speeds under normal conditions.

Start-up characteristics

- a) Drive side: The max. torque of the drive machine under start-up conditions is to be taken into consideration. The start-up torque, e.g. for three-phase squirrel cage motors amounts to 2 to 2.5 times the rated value.
- b) On the drive side: If necessary, „initial torques“ affecting to the drive part timing belt are to be taken into consideration under start-up characteristics.

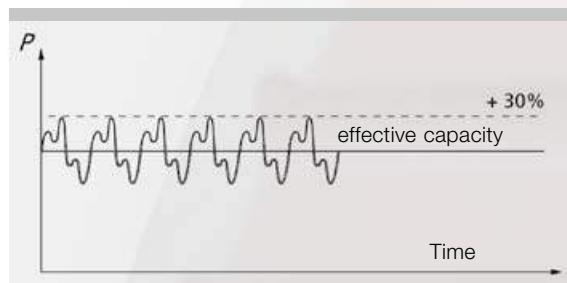

Check load case a) or b) with rotational speed $n=0$.

Braking

It might have to be defined whether braking leads to loads which fully act via the timing belt and possibly exceed the type of load produced by the rated operation or the start-up characteristics. During braking a possible torque reversal should be taken into consideration.

Unevennesses (load variations, shock loads)

In addition to the rated load, superimposed vibration and shock loads could act on the timing belt as the transmission member. For the illustrated example, increase the calculated belt width by the factor of 1.3.

It is important, that the unfavourable load types occurring in the drive are known resp. correctly estimated by the engineer. With a positive fit transmission, even short-period overloads act via the timing belt being the drive member. Some instructions to this issue:

Moments of inertia

Moments of inertia and/or centrifugal masses in the drives generally create a uniform running behaviour. Depending on the acceleration and deceleration characteristic it has to be differentiated and checked whether the moments of inertia create an additional load on the timing belt.

Step-up transmission

The following safety factors are to be applied for step-up transmissions:

$i = 0,66$ up to 1,00	$S = 1,1$
$i = 0,40$ up to 0,66	$S = 1,2$
$i < 0,40$	$S = 1,3$

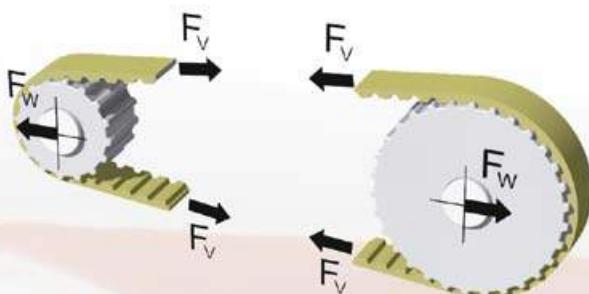

During braking a torque reversal may occur which would change a reduction ration into a step-up drive.

Pre-tension force

Pre-tension force

Pre-tension is intended to guarantee a minimum tensioning force at the slack span side to ensure smooth tooth meshing into the driven pulley.

Generally, the pre-tension should only be set as high as necessary. The necessary pre-tension force of the spans F_v depends on the max. peripheral force F_u , the belt length L_B (number of teeth Z_B) and the drive configuration.

The recommendations shown in the table refer to the pre-tension force setting per span.

Drive configuration	Pre-tension force of each individual span	
Two-shaft drive		
$Z_B < 60$	$F_v = 1/3 F_u$	
$60 \leq Z_B < 150$	$F_v = 1/2 F_u$	
$Z_B > 150$	$F_v = 2/3 F_u$	
Multiple-shaft drive		
$I_{\text{Load span}} \leq I_{\text{Slack span}}$	$F_v = F_u$	
$I_{\text{Load span}} > I_{\text{Slack span}}$	$F_v > F_u$	
Linear drive	$F_v \geq F_u$	

In every case, the tension cord strength is the top limit of the span load. Take into consideration that especially with multiple-shaft and linear drives, an addition of the pre-tension force and the peripheral force in relation to the load span force is to be expected.

Influencing factors

Belt stiffness

Friction forces created by the interaction of the tooth mesh (especially at the slack span) intensify the span forces, which in turn increase the degree of elongation. This influence may lead to the slack span tooth mesh butting against the driven pulley, thereby causing the belt to jump. Elongation being directly depending on the belt stiffness, the high stiffness of the steel cord tension members permits a comparably low pre-tension.

Peripheral force

The peripheral force acts in proportion to the elongation of the load span, i.e. excessive slackening of the slack span can be counter-acted by a pre-tension matched to the peripheral force.

Belt length

Belt elongation resulting from the effect of the peripheral force and the friction forces is also approximately in proportion to the belt length. Therefore, the tendency of running up or jumping is considerably influenced by the belt length. Even under high peripheral forces with the resulting friction forces, a very short timing belt will elongate to only a small degree, so that even when subject to low pre-tension forces there will be no danger of running up or jumping of teeth. On the contrary, with short timing belts peripheral deviations of the pulleys could cause heavy pre-tension fluctuations and, as a result, extreme peak values.

Proportion of the span lengths

Especially with multiple-shaft drives the load span is often markedly longer than the slack span side. For this reason, a slight elongation of the load span results in a very unfavourable slack on the span side. Therefore, the pre-tension force of spans of such ratios should be higher than the peripheral force.

Precise transmission of movement

There is a high transmission accuracy possible in the reverse operation with CONTI SYNCHROFLEX® Timing Belts, when the span pre-tension forces are selected in the same size of the peripheral force.

Pre-tension force

Consequences of faulty pre-tension setting:

too low pre-tension

- the teeth of the slack span side run up on or override the teeth of the driven pulley
- Wear on the faces caused by the friction force during meshing
- Forced breakage by excessive elongation due to full overriding

excessive pre-tension

- high bearing load of the shafts
- Reduction of the transmittable power
- Wear and tear at the belt tooth

Measuring with frequency measuring meter

The intrinsic frequency of a vibrating belt span can be measured by means of various Mulco belt tension measuring meters. The pre-tension force of the span can be calculated from the measured intrinsic frequency:

$$F_v = 4 \cdot m \cdot l_T^2 \cdot f^2$$

The corresponding intrinsic frequency can be calculated, if the pre-tension is preset:

$$f = \sqrt{\frac{F_v}{4 \cdot m \cdot l_T^2}}$$

f: Frequency of the variations in Hz

m: Mass of the belt per meter length in kg/m

l_T : drum span length subject to vibration in m

F_v : Span force in N

Please contact your Mulco partner for the various measuring meters (see page 16).

General informations

Design

- In the transmission configuration, design at least one adjustable axis, plan one adjustable tension roller (not spring-loaded) for fix centre distances
- the bearing has to be absolutely rigid
- Note the importance of a parallel run and flush alignment of the timing pulleys

Transport/storing

- Upon receipt, unpack the timing belt immediately and store in circular position (SYNCHROFLEX® Timing Belts) in a dry place at room temperature
- Do not bend

Mounting

- Fit timing belts on the pulleys when slack without exerting any force
- Exert no force when fitting with fixed centre distances (SYNCHROFLEX® Timing Belts) if necessary, fit together with timing pulleys
- Apply pre-tensioning force according to the chapter „Pre-tension“
- secure adjustable axis against slippage
- Do not clamp the timing belt between the flanges

Operation

- Protect the drives against dust, dirt, hot surrounding media as well as acids and alkalis
- Take into consideration the ambient temperatures (see Characteristics of polyurethane timing belts)

Basis of calculation

Providing the following conditions of tooth strength (1st), tension member tensile strength (2nd) and flexibility (3rd)

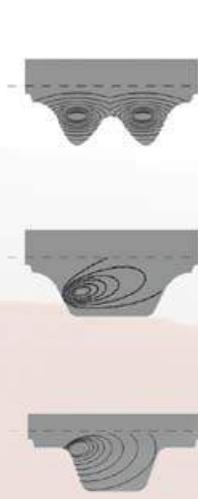

are met, then a maintenance-free timing belt operation can be expected.

1. Tooth shear strength specific tooth shear strength

Force distribution

Load distribution

The specific tooth shear strength depends on the rotational speed. The maximum specific tooth shear strength is the limit load the belt tooth can bear in continuous operation. The values are stated in tables for each timing belt type. The timing belt drive is correctly designed, when not exceeding the admissible tooth shear strength. Generally, a special safety factor is not necessary, see chapter „Safety factors“.

The high specific tooth shear strength of the ATP profile, for example, is achieved by the optimised force and load distribution. The effective force is distributed to two tooth faces.

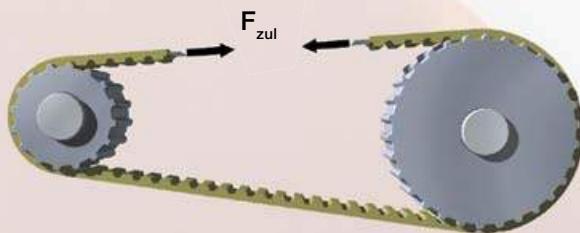

The working loads can be distributed more effectively with more belt teeth meshing in the pulley.

Due to the high pitch accuracy of CONTI SYNCHROFLEX® Timing Belts, generally, it can be calculated with 12 belt teeth in mesh, unless there are less than that number actually in mesh.

2. Tension member strength

Admissible tensile stress on the belt's cross-section

The timing belt is designed correctly, when the maximum admissible tensile force in the steel cord tension members is not exceeded under operation conditions. The table values for F_{zul} refer to the constant loading.

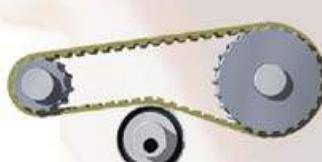

3. Flexibility

Minimum number of teeth, minimum diameter

The recommended minimum number of teeth and/or the minimum diameter for a malfunction-free operation depends on the selected belt type. Take especially into consideration that the minimum number of teeth and/or the minimum diameter is higher when using a belt arrangement „with contraflexure“ (e. g. due to a tension roller).

Drive layout without contraflexure

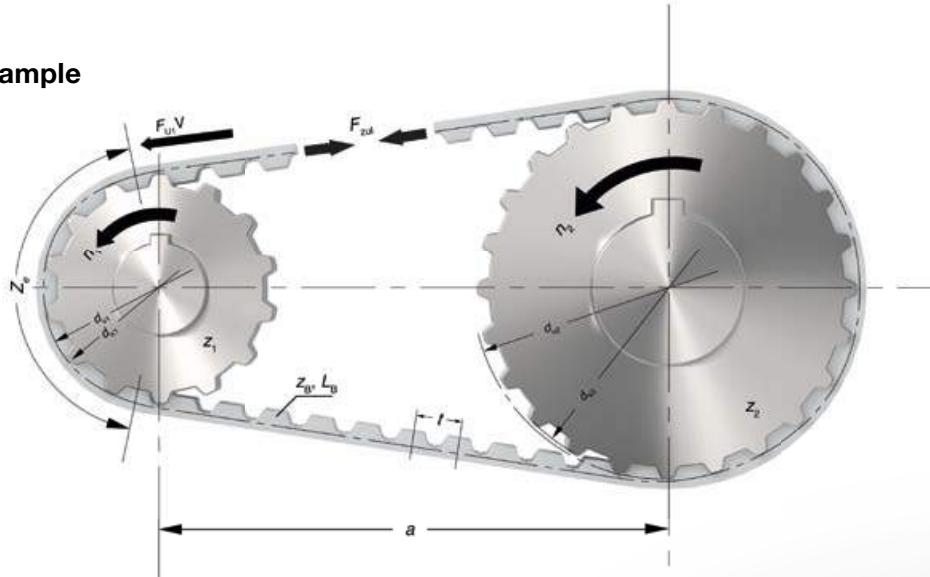

Drive layout with contraflexure

Pitch circle diameter

$$d_0 = \frac{z \cdot t}{\pi}$$

Apply all equations with the dimensions mentioned here.

Calculation example

Task A roll table drive must be designed for heavy conveying duties. Under start-up conditions approx. 2.5 times the running torque is exerted on the timing belt.

The application conditions are:

Given:	Power	$P = 10 \text{ kW}$
	Nominal speed	$n = 800 \text{ min}^{-1}$
	Start-up torque	$M = 300 \text{ Nm}$
	Ratio	$i = 1$
	Number of teeth	$z = 25$
	Centre distance	$a = 625 \text{ mm}$

Required: The timing belt pitch is to be determined and the belt width is to be calculated.

$$\text{Formulea: } b = \frac{100 \cdot M}{z_1 \cdot z_e \cdot M_{\text{spec}}} \quad M[\text{Nm}]$$

$$b = \frac{1000 \cdot P}{z_1 \cdot z_e \cdot P_{\text{spec}}} \quad P[\text{kW}]$$

$$F_u = \frac{2 \cdot 10^3 \cdot M}{d_0} \quad F_u [\text{N}]$$

$$L = 2 \cdot a + z \cdot t \quad [\text{mm}]$$

$$d_0 = \frac{z \cdot t}{\pi} \quad [\text{mm}]$$

Calculation example

How to proceed

Belt length: Profile preselection: AT10. Calculation of the belt length with formula:

$$\begin{aligned} L &= 2 \cdot a + z \cdot t \\ &= 2 \cdot 625 + 25 \cdot 10 \\ &= \underline{1500 \text{ mm}} \end{aligned}$$

Calculation of the belt width:

1. Tooth shear strength

In the calculation $z_e = 12$ will be used (see basis of calculation).

Calculation of the belt width with the nominal speed from the power equations.

$$\begin{aligned} b &= \frac{1000 \cdot P}{z_1 \cdot z_e \cdot P_{\text{spec}}} \\ &= \frac{1000 \cdot 10}{25 \cdot 12 \cdot 6,96} \\ &= 4,79 \text{ cm} = \underline{47.9 \text{ mm}} \end{aligned}$$

Calculation of the belt width under start-up torque when rotational speed $n = 0$.

$$\begin{aligned} b &= \frac{100 \cdot M}{z_1 \cdot z_e \cdot M_{\text{spec}}} \\ &= \frac{100 \cdot 300}{25 \cdot 12 \cdot 11,70} \\ &= 8,54 \text{ cm} = \underline{85.4 \text{ mm}} \end{aligned}$$

The belt width is to be determined from the least favourable load conditions.
Selected: the next larger standard belt width $b = \underline{100 \text{ mm}}$.

2. Tension member strength

The corresponding peripheral force can be calculated from the general data supplied:

$$\begin{aligned} F_u &= \frac{2 \cdot 10^3 \cdot M}{d_0} \\ &= \frac{2 \cdot 10^3 \cdot M}{79,58} = \underline{7539 \text{ N} < 16000 \text{ N}} \end{aligned}$$

The tabular value F_{zul} for AT 10 with 100 mm belt width is 16000 N. Thus, there is a sufficient tension member safety factor.

3. Flexibility

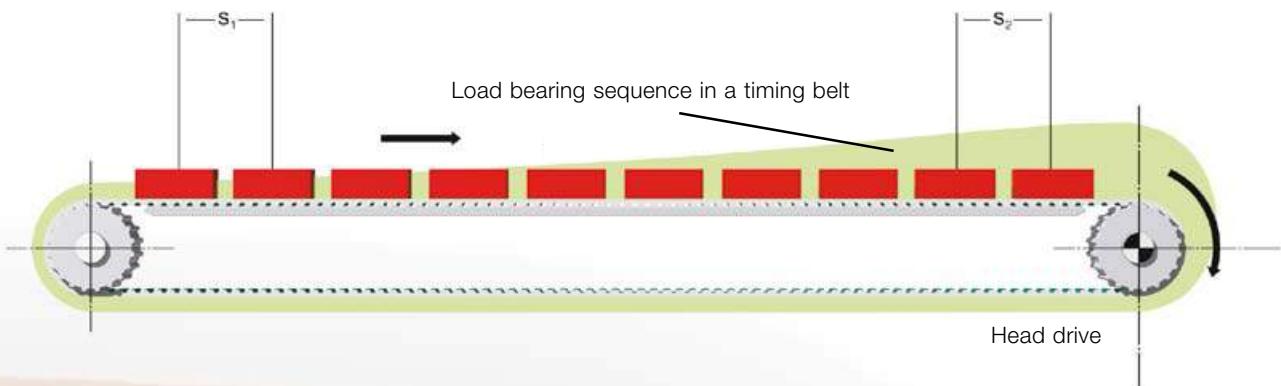

The design is a drive „without contraflexure“. The minimum number of teeth according to the table is adhered to.

Result: The drive is correctly designed with a belt width of 100 mm. A maintenance-free operation can be expected.

Order code: CONTI SYNCHROFLEX® 100 AT 10/1500

CONTI SYNCHROFLEX® Timing Belts used for transportation

Transport belts should be designed preferably with a head drive. The goods to be transported can consist of one or more individual loads. Multiple individual loads can be seen as a line load.

Calculation of the Peripheral force F_u

From the overall transport load, the required haul-off force or the peripheral force F_u for the drive pulley assemblies can be derived:

$$F_u = 9,81 \cdot m \cdot \mu$$

Peripheral force at the drive pulley.

F_u	[N]
m	[kg]

Mass of the items to be transported

Friction factor of the timing belt

in relation to the bed plate

μ

As friction factor μ (slide friction), the following values can be assumed:

Steel/PUR 92 Shore A	0,6 - 0,7
PE/PUR	0,3 - 0,4

In general, friction factors show large ranges. Trials should be carried out, if necessary. Errors and omissions excepted.

Information on the force/elongation behaviour

The grid surface in the picture shows the force/elongation behaviour in the timing belt under operating conditions. The individual spacing between the transported products increases towards the drive pulley due to belt elongation.

Centre $s_1 < s_2$

Pre-tension force

We recommend to set the pre-tension force in the transport timing belt such that a residual pre-tension force is always maintained on the slack span side under operating conditions. The following pre-tension force is required::

$$F_v > 0,5 \cdot F_u$$

Calculating the Belt width b

$$b = \frac{F_u}{Z_e \cdot F_{U_{spec}}} \quad F_u [\text{N}]$$

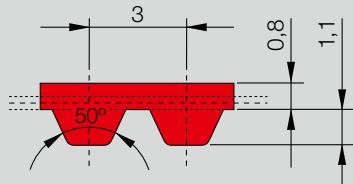

F_u : peripheral force (calculated)

$F_{U_{spec}}$: specific load of the belt teeth

Z_e : number of teeth in mesh for endless joined belts:
 $Z_{emax} = 12$

AT high performance Timing Belts

3. Flexibility (Minimum numbers of teeth, minimum diameter)

Timing pulley	z_{\min}	20		Drive type without contraflexure
Tension roller (smooth), running on teeth	d _{min} [mm]	100		
Timing pulley	z_{\min}	30		Drive type with contraflexure
Tension roller (smooth), running on the back of the belt	d _{min} [mm]	60		

AT high performance Timing Belts

AT 20 GEN III

CONTI SYNCHROFLEX® Timing Belt (SFX) AT 20 GEN III

High performance AT profile with metric pitches and trapezoidal teeth.

Standard version:

- single-sided
- high performance polyurethane in red colour
- steel cord tension members with high density
- steel cord tension members in two-filament construction

Type / Length* GEN III	Number of teeth	Type / Length* GEN III	Number of teeth

3. Flexibility (Minimum numbers of teeth, minimum diameter)

Timing pulley	z_{\min}	10		Drive type without contraflexure
Tension roller (smooth), running on teeth	d_{\min} [mm]	15		
Timing pulley	z_{\min}	18		Drive type with contraflexure
Tension roller (smooth), running on the back of the belt	d_{\min} [mm]	15		

T standard Timing Belts

T 5 / T 5-DL

CONTI SYNCHROFLEX® Timing Belt (SFX) T 5

CONTI SYNCHROFLEX® Timing Belt (SFX) T 5-DL

Standard T profile according to DIN 7721
with metric pitch and trapezoidal teeth.

The technical data refer to standard polyurethane
and standard steel cord tension members.

Available versions:

- single-sided (as standard)
- with "E" tension member for a better flexibility
- with Aramide tension member
- polyurethane special materials upon request
- antistatic, coloured, mechanical reworked

DL: double-sided

FA: with bigger back thickness

FN: with profiles on the back of the belt

* Other dimensions upon request.
** In combination with reduced pulley gap
please ask for technical support from
your Mulco sales partner.

CONTI SYNCHROFLEX® Timing Belt (SFX) T 20-DL

Standard T profile according to DIN 7721
with metric pitch and trapezoidal teeth.

The technical data refer to standard polyurethane
and standard steel cord tension members.

Available versions:

- single-sided (as standard)
- with "E" tension member for a better flexibility
- with Aramide tension member (except DL)
- polyurethane special materials upon request
- antistatic, coloured, mechanical reworked

DL: double-sided

CONTI SYNCHROFLEX® Flat Belt 10 V 177 / 5 F

Belt width in mm _____

Type/Length _____

Coated timing belts

CONTI SYNCHROFLEX® Timing Belts consist of wear resistant polyurethane (PUR) and high tensile steel cord tension members. The coating of the timing belts with various materials provides a variety of application possibilities in the transport technology.

The selection of the correct coating depends on the transport item properties and the required grip. High friction for a good carrying effect, low friction to reduce the power transmission performance, soft for sensitive items or hard for sharp-edged items are the determining factors.

Every material involved assumes its task according to its specific property.

To meet specific transport applications, the tooth side and/or the transport side can be mechanically reworked. In this manner, the flexibility of the entire belt can be restored by making incisions in thick coatings.

Resistance

Depending on the application the resistance of each material part of the coated timing belt is to be viewed separately. The material resistance depends, among others, on the pH value, the concentration, the temperature and the influencing time of the medium. Simple oils generally have no damaging effect on the belt. Additives in the oil and temperatures over approx. 40°C can reduce the longevity.

Friction

The friction of the belt on a support produces heat. This increases the more the belt is loaded by the items to be transported. The bed support must be selected such that the friction value of the transport belt in contact with the material of the bed plate results in a minimum value. The bed plate should guarantee good heat dissipation under high pressure forces.

The friction value is temperature dependent. It increases as the temperature rises and reduces at temperatures below zero (frost).

Information

You should ask for advice for coatings over 75 mm wide and approx. 2 mm thick because of the different processing properties.

Drives with contraflexure

Generally, coated timing belts are suitable for drives with contraflexure. Very smooth coatings (e.g. Sylomer) must be adjusted with reduced pre-tension.

Temperature influence

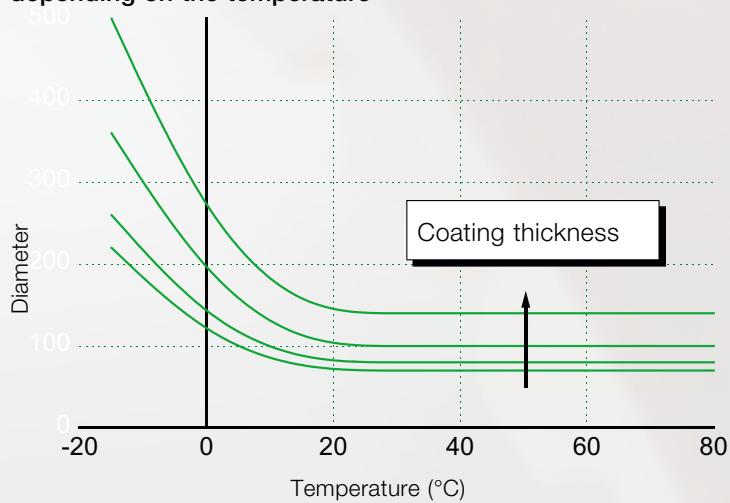

If hot items (above approx. 80°C) are transported, ensure that the contact time is as short as possible to avoid heating of the belt substructure to over 80°C. A coated belt can resist a thermally higher load over short distances or a short period, assuming that there being sufficient cooling for the remainder of the revolution.

The tooth shear strength is slightly reduced in a temperature range of over approx. 60°C. An additional safety factor is only required with a high tooth load.

The flexibility of the coating is reduced with low ambient temperatures. To this effect, select larger timing pulley diameters compared to normal temperatures (see diagram). The flexibility of the timing belt is also reduced with low temperatures.

The stated minimum diameters are standard values. They are valid with the ambient temperature of 20°C and a speed of 1m/s. A low load of the goods to be transported is presumed. Reducing the diameters is possible with precise knowledge of the application. Relevant advice can be obtained from your Mulco partner.

Synchronising pulley diameter depending on the temperature

Coated timing belts

NP 385

Material designation:	polyurethane
Colour:	transparent
Hardness:	85 Shore A
Available thickness:	4 mm
Minimum diameter:	120 mm
Temperature resistance:	-20°C to +50°C
Resistances:	resistant against simple oils and fats
Properties:	nub tip contact with the product to be transported
Application fields:	transport with oil influence, sheet transport, elevator, brick making, glass industry

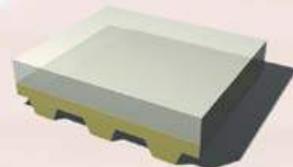

FG 385

Material designation:	polyurethane
Colour:	transparent
Hardness:	85 Shore A
Available thickness:	4 mm
Minimum diameter:	120 mm
Temperature resistance:	-20°C to +50°C
Resistances:	resistant against simple oils and fats
Properties:	linear contact of the product to be transported
Application fields:	transport with oil influence, sheet transport, elevator, brick making, glass industry

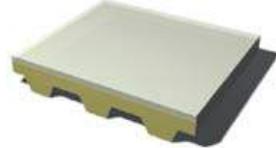

PUR 385

Material designation:	polyurethane
Colour:	transparent
Hardness:	85 Shore A
Available thickness:	3 4 5 6 mm
Minimum diameter:	80 120 150 180 mm
Temperature resistance:	-20°C to +50°C
Resistances:	resistant to petrol, ozone, simple fats and oils
Properties:	high resistance to wear, high coefficient of friction
Application fields:	transport of parts showing a coarse surface or burrs, woodworking and sheet fabricating industry, glass industry, cardboard transport

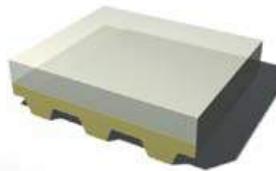

HV1 film

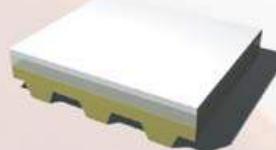

Material designation:	polyurethane
Colour:	transparent, shiny
Hardness:	88 Shore A
Available thickness:	1 mm
Minimum diameter:	60 mm
Melting range:	approx. 166°C
Resistances:	resistant to some cleaning agents
Properties:	good wear resistance, adhesive
Application fields:	foodstuff industry, glass and woodworking industry, sheet fabricating industry, cardboard transport

**Polythane D15**

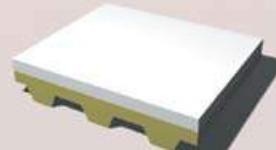

Material designation:	polyurethane
Colour:	transparent/yellowish
Hardness:	70 Shore A
Available thickness:	2 – 3 to 6 mm
Minimum diameter:	60 – 80 mm
Temperature resistance:	80°C
Resistances:	resistant against simple oils and fats
Properties:	wear resistant
Application fields:	general transport tasks, woodworking and glass industry, sheet fabricating industry

**Compound coating**

Material designation:	e.g. PUR/silicone
Colour:	white
Hardness:	60 / 50 Shore A
Available thickness:	2.4 mm
Minimum diameter:	60 mm
Temperature resistance:	in accordance with the materials used, Silicone: short-term 180°C
Resistances:	in accordance with the materials used
Properties:	non-stick
Application fields:	light weight transport tasks, air filter transport, textile and wood industry

**PVC white**

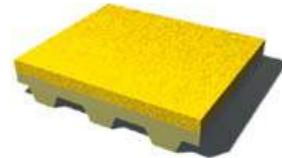

Material designation:	PVC
Colour:	white
Hardness:	approx. 40 Shore A
Available thickness:	2 mm (more thicknesses on request)
Minimum diameter:	60 mm
Temperature resistance:	-15°C to +90°C
Resistances:	top covering layer is resistant against acid, salts and bases
Properties:	FDA approval for contact with foodstuff
Application fields:	foodstuff industry, film processing, pharmaceutical and packaging industry

Coated timing belts

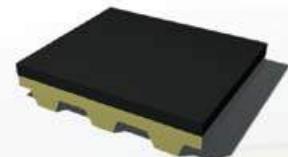

PU yellow

Material designation:	polyurethane							
Colour:	yellow							
Hardness:	approx. 55 ± 7 Shore A							
Available thickness:	2	3	4	5	6	8	10	mm
Minimum diameter:	60	60	80	100	100	100	20	mm
Temperature resistance:	-10°C to +60°C							
Resistances:	resistant against simple oils and fats							
Properties:	good wear resistance, very good to rework							
Application fields:	vacuum transport belts subject to high loads, paper industry, textile industry, glass and wood industry							

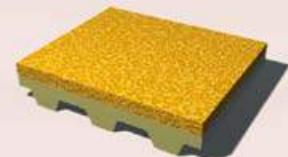

Porol

Material designation:	cellular rubber							
Colour:	black							
Density, hardness:	190 g/dm³, approx. 15 Shore A							
Available thickness:	3	5	10	mm				
Minimum diameter:	40	60	80	mm				
Temperature resistance:	-40°C to +70°C							
Resistances:	resistance to some simple fats and oils							
Properties:	smooth foam quality, high coefficient of friction							
Application fields:	transport of sensitive parts, paper industry, textile industry, cardboard transport							

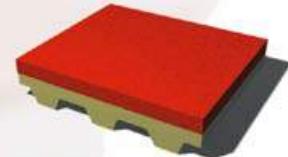

Celloflex

Material designation:	microcellular elastomeric polyurethane							
Colour:	yellow-brown							
Density:	350 g/dm³							
Available thickness:	1	2	3	4	5	mm		
Minimum diameter:	40	40	60	60	80	mm		
Temperature resistance:	-30°C to +80°C							
Resistances:	resistance to some simple fats and oils							
Properties:	highly flexible, high damping ratio							
Application fields:	transport of sensitive items, film and packaging industry, textile transport							

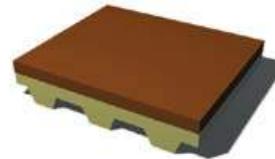

Linatex

Material designation:	natural rubber									
Colour:	red									
Hardness:	approx. 40 Shore A									
Available thickness:	1.5	2.4	3	5	6.4	8	10	12	20	mm
Minimum diameter:	25	30	40	40	40	40	60	80	80	mm
Temperature resistance:	-40°C to +70°C									
Resistances:	resistant to some oils and abrasion when wet									
Properties:	wear resistant to a limited extent, high coefficient of friction, high resistance to rupture, is still flexible at lower temperatures, please request for advice for coating thicknesses over 2.4 mm									
Application fields:	transport or haul-off belts subject to high friction, wood, paper, textile industry, transport with a high acceleration									

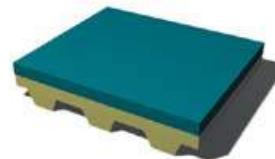

Sylomer

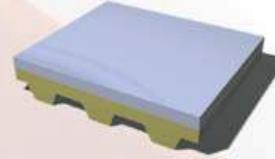

Material designation:	Elastomeric PUR		
Colour:	Blue (R)	Green (L)	Brown (M)
Density:	220	300	400 g/dm ³
Available thickness:	3-25	3-25	3-25 mm
Minimum diameter:	80 - 120	80 - 120	80 - 120 mm
Temperature resistance:	-30°C to +70°C		
Resistances:	resistance to some oils and fats		
Properties:	good wear resistance, not suitable for sharp edges		
Application fields:	transport of light weight parts, paper and textile industry, haul-off belts, pressure belts		

**PVC blue**

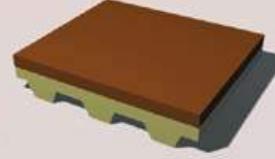

Material designation:	PVC		
Colour:	blue		
Hardness:	approx. 40 Shore A		
Available thickness:	1 mm		
Minimum diameter:	30 mm		
Temperature resistance:	-15°C to +90°C		
Resistances:	top covering layer is resistant against acid, salts and bases		
Properties:	high coefficient of friction		
Application fields:	paper, film, wood and sheet transport, pharmaceutic and packaging industry, application in card reading units		

**Chrome-leather**

Material designation:	leather		
Colour:	grey-blue		
Hardness:	-		
Available thickness:	2	3	mm
Minimum diameter:	80	100	mm
Temperature resistance:	60°C		
Resistances:	resistant against simple oils and fats		
Properties:	good friction even with oiled surfaces of items to be transported, good wear resistance behaviour		
Application fields:	transport of fatty or oily parts, sheet and tube industry, transport of sensitive products, caterpillar haul-offs in the cable industry, transport of lacquered parts		

**Correx**

Material designation:	para rubber		
Colour:	brown		
Hardness:	approx. 35 to 40 shore A		
Available thickness:	6	10	mm
Minimum diameter:	80	120	mm
Temperature resistance:	up to approx. 70°C		
Resistances:	resistant to some oils and fats		
Properties:	wear resistant quality, good carrying behaviour		
Application fields:	general transport tasks, sheet and tube transport, cardboard transport		

Coated timing belts

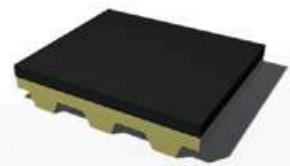

PVC herringbone

Material designation:	PVC
Colour:	white
Hardness:	approx. 65 Shore A
Available thickness:	3 mm
Minimum diameter:	60 mm
Temperature resistance:	-10°C to +110°C
Resistances:	resistant to some oils and fats
Properties:	FDA approval for contact with foodstuff
Application fields:	foodstuff industry, elevators, transport of glass in wet areas

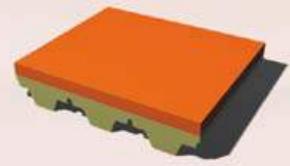

Viton

Material designation:	FKM mix
Colour:	black
Hardness:	75 ± 5 Shore A
Available thickness:	2 - 4 mm
Minimum diameter:	80 - 100 mm
Temperature resistance:	-10°C to +275°C
Resistances:	high heat resistance, resistant against simple oils and fats, petrol, acids, lyes, ozone
Application fields:	short-term transport of parts with high residual heat, belts with glue and adhesive contact, metal part and glass transport

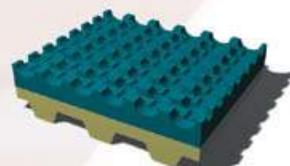

Linatrine

Material designation:	vulcanized material based on nitrile
Colour:	orange
Hardness:	55 Shore A
Available thickness:	3-6 mm (more thicknesses on request, max. 25 mm)
Minimum diameter:	depending on the selected thickness, the thicker the coating the larger the diameter must be selected
Temperature resistance:	-20°C to +110°C
Resistances:	resistant against oil, fat and other chemicals
Properties:	good wear resistance, ageing stability, fatigue resisting
Application fields:	haul-off belts in the textile area, transport of waxy materials

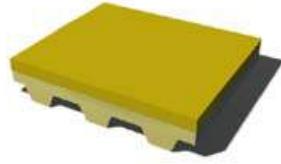

Supergrip green/blue

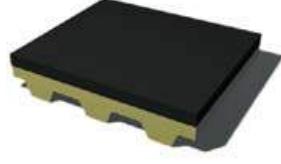

Material designation:	PVC
Colour:	green blue
Hardness:	approx. 40 Shore A approx. 40 Shore A
Available thickness:	4 mm 4 mm
Minimum diameter:	60 mm 60 mm
Temperature resistance:	-15°C to +90°C -15°C to + 90°C
Resistances:	resistant against simple oils and fats not resistant to oil
Properties:	high resistance to wear, high coefficient of friction
Application fields:	particularly suitable for inclined conveying, transport of light weight items, elevators in the wood and paper industry

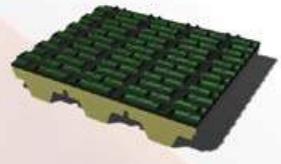

RP 400

Material designation:	rubber	 yellow
Colour:	yellow	
Hardness:	35 Shore A	
Available thickness:	2 3 4 5 6 mm	
Minimum diameter:	30 40 40 60 60 mm	
Temperature resistance:	-10°C to +80°C	
Resistances:	resistant to some oils and fats	
Properties:	very high resistance against wear and tear	
Application fields:	glass and steel industry, abrasive material up to a size of 40 mm	

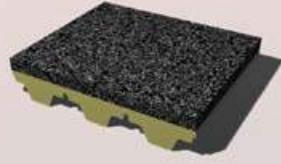

NBR

Material designation:	Nitrile Butadiene Rubber	 black
Colour:	black	
Hardness:	65 ± 5 Shore A	
Available thickness:	1,5 3 mm	
Minimum diameter:	60 80 mm	
Temperature resistance:	-20°C to +70°C	
Resistances:	well resistant against oils, resistant to a limit extent against petrol, acid and alkalis	
Application fields:	general transport tasks	

PVC Minigrip

Material designation:	PVC	 green/blue
Colour:	green/blue	
Hardness:	approx. 65 Shore A	
Available thickness:	1,5 mm	
Minimum diameter:	30 mm	
Temperature resistance:	-10°C to +110°C	
Resistances:	resistant to some oils and fats	
Properties:	high coefficient of friction	
Application fields:	transport of damp parts, good carrying behaviour due to profiled surface	

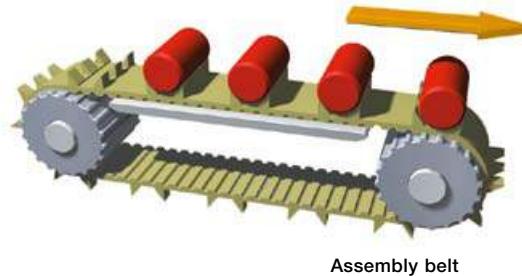

TT 60

Material designation:	polyester fleece	 black
Colour:	black	
Available thickness:	2 mm	
Minimum diameter:	120 mm	
Temperature resistance:	-10°C to +120°C	
Resistances:	resistance to oils and fats	
Properties:	electro-static properties	
Application fields:	glass industry as transport belt in the hot area	

Integrated flights

CONTI SYNCHROFLEX® Timing Belts with cast flights/profiles:

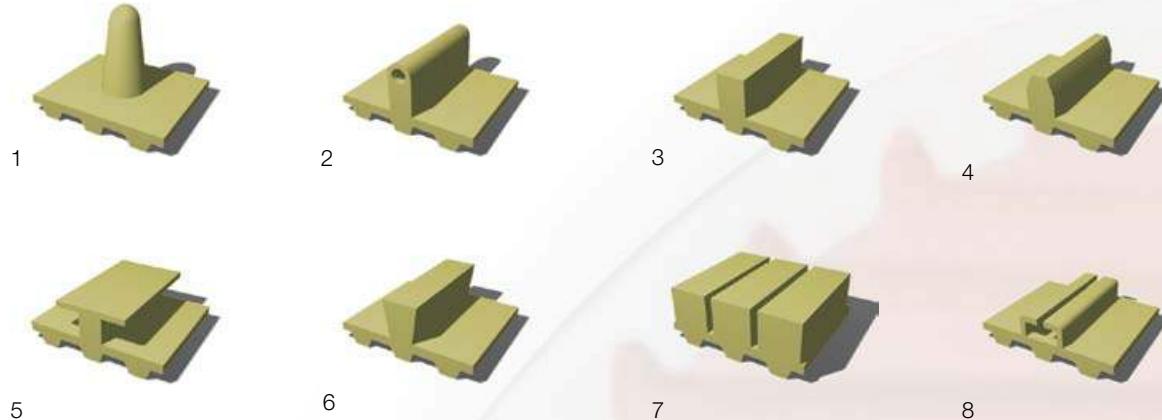

CONTI SYNCHROFLEX® Timing Belts with profiles offer further opportunities for the designer with flights or cleats on the belt back. Can be used in conveying, feeding or positioning.

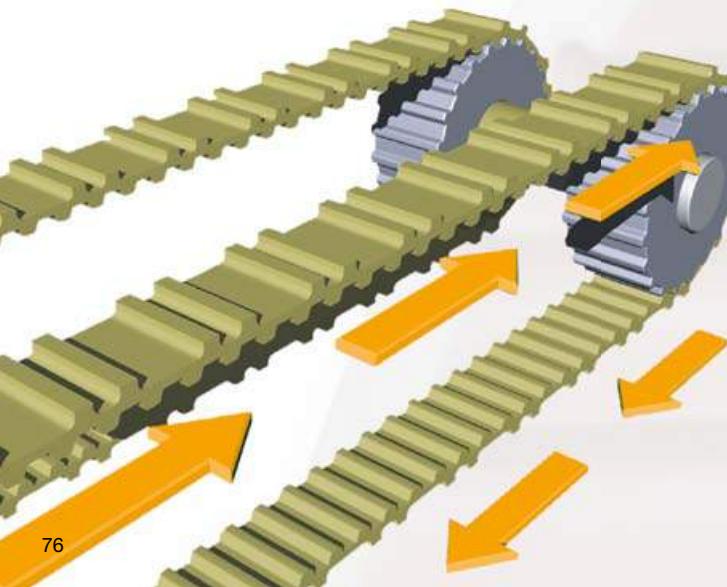

Maximum precision is achieved by the manufacture in one operating step using a timing belt mould. Customer requirements with regard to the shape of the flights and

their number can be taken into consideration at the time of producing a new mould. Best flight centre distance tolerance achievable: +/- 0.05 mm.

Examples of flighted CONTI SYNCHROFLEX® Timing Belts from a single mould:

Application example

Applications:

- Synchronising technology to achieve maximum precision
- EDP equipment
- Office machinery
- Fine mechanical technology
- Packaging machinery
- Indexing systems
- Synchronous conveyors
- Handling technology
- Transport technology

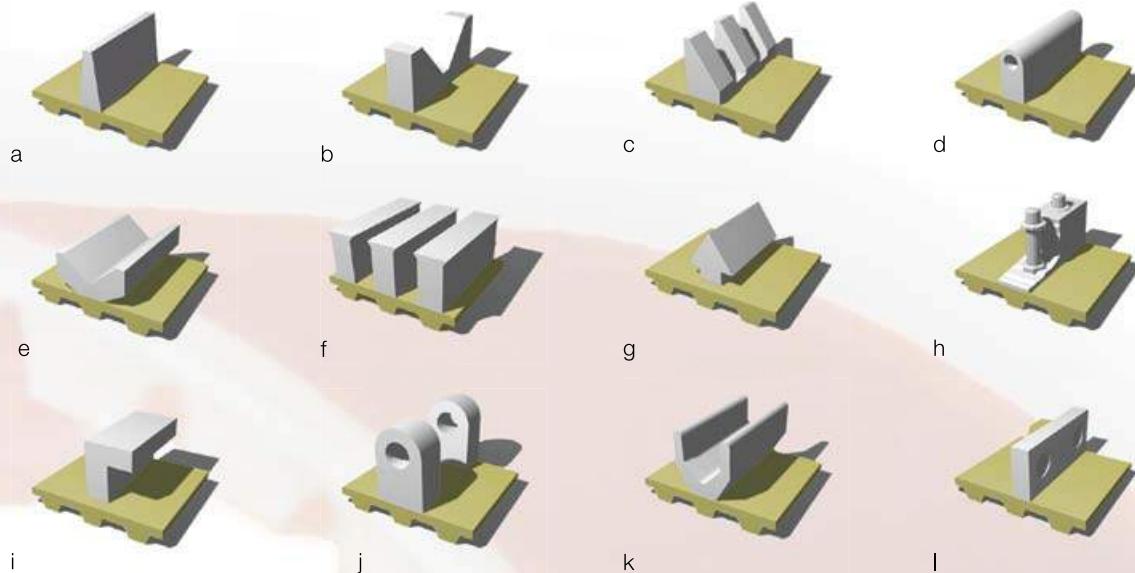

Please contact us for technical advice if you require more detailed information on special belt dimensions (existing timing belt moulds).

CONTI SYNCHROFLEX® Timing Belts

with welded flights/profiles:

All CONTI SYNCHROFLEX® Timing Belts as from pitch T 2.5 can be retrofitted with flights. In line with the customer's drawing, the desired number of flights are thermally butt-welded to the back of the belt. The achievable weld-on tolerance of each individual flight is ± 0.5 mm. Hundreds of shapes of flights are available. Please ask for additional information. For special customer requirements new flights can be manufactured.

Examples of possible flight shapes requiring mechanical re-work:

The various shapes of flights allow an adaptation of the transport timing belt to the envisaged practical function. The flight pitch is freely selectable. The flights can be manufactured with moulded inserts. Profile attachments can be retrofitted (positioned). The welding point itself and the maximum bending stress are subject to special parameters.

Please contact us for technical advice.

Applications:

General transport technology

- Conveying/transporting
- Separation
- Positioning
- Indexing
- Feeding

Brush timing belts

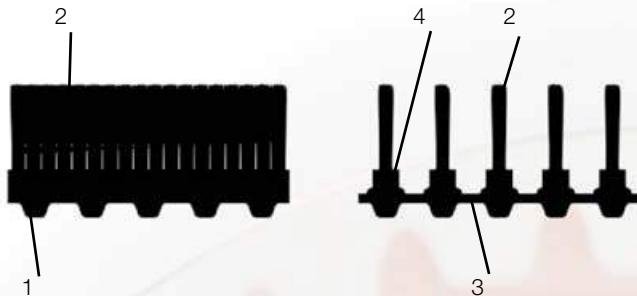

A solution for almost every application

To complement standard applications in power transmission, linear and transport technology, we offer the CONTI SYNCHROFLEX® Brush Timing Belt for special applications.

Construction

The timing belt is either equipped with a stronger back with brush or - to meet the individual application - with brush flights. The thickness of the back is between 10 and 20 mm, depending on the fibre thickness and cutting length. Flight centre-distance, fibre density and type are individually matched to each application.

1. Timing belts with reinforced back (the necessary flexibility is achieved by notches in the back of the belt).
2. Brushes/fibres
3. Standard timing belt
4. Profile

Versatile application

Conveying:

- Transport of sensitive parts for example: glass, ceramics, paper
- Conveying of materials featuring delicate surfaces
- Accumulation conveying due to the extremely low coefficient of friction
- Larger contact surface resulting from the fanned fibre arrangement
- Reduced conveying noise
- Dirt and chips cannot accumulate on the contact surface
- Combination with all transport flights

Cleaning:

- Dry and wet application
- Surface treatment

Product range

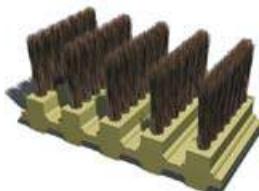

Brush timing belts are available in any length offered in our product range and in the following pitches:

T 5, T 10, T 20, AT 5, AT 10, AT 20

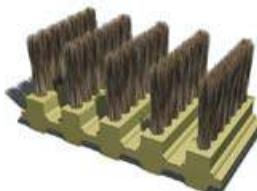

Please contact us for more detailed information on fibre materials, data on chemical resistances and admissible temperature ranges.

Ø 0,1 - 0,4 mm
straight or corrugated

Mechanical rework

CONTI SYNCHROFLEX® Timing Belts can be mechanically reworked to meet special functional features. Timing belts with a thick backing are especially suited for mechanical rework. They offer far reaching design possibilities for the designer.

Available types: Version FA and coatings/coverings
Please note that the flexibility of timing belts with a thicker back is reduced and therefore, requiring larger pulley diameters. Belt flexibility can be improved by cross grooving or incisions.

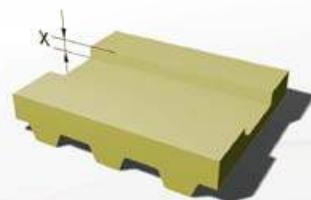

Back cross milling

Cross grooves on the belt back enhance the flexibility of the belt. Milled grooves are, in as much as they are possible from the technical feasibility point of view, used to improve safe loading and secure positioning of the products on the belts.

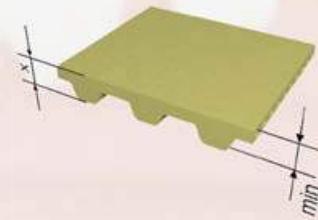

Back longitudinal milling

Independent on the belt pitch, the belt back shaping offers a wide range of design variants for customised solutions. In this manner, belt guiding can be achieved by a trapezoidal back profile, or a round section supported and moved by means of a prism shaped cross section. Dimensions are to be indicated as depth measure x in relation to the belt back.

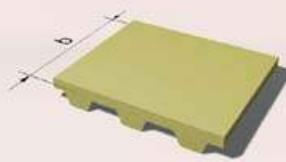

Back grinding

All CONTI SYNCHROFLEX® Timing Belts can be ground and finished for reasons of precision or in order to obtain a roughened surface. Note that the belts must not be ground to anything less than the overall thickness x because otherwise the tension members might take damage.

Edge grinding

Particularly accurate belt width tolerances can be achieved by grinding the belt edges.

Removing individual teeth

The removal of individual teeth or groups of teeth is possible and practical due to the high dimensional precision meshing, when the remaining teeth are to serve as precise position load areas.

Longitudinal milling of teeth

Machining the tooth profile is significant for CONTI SYNCHROFLEX® Timing Belts which are protected from running off laterally for instance by bed plates. The processing depth x is indicated as measured from the tooth top surface.

Perforated timing belts

Aramid tension members should be preferably used with CONTI SYNCHROFLEX® Timing Belts in this type of application.
